

TOSHIBA MOS MEMORY PRODUCTS

131,072 WORD×8 BIT CMOS ONE TIME PROGRAMMABLE
READ ONLY MEMORY
SILICON STACKED GATE MOS

TC541000P-20, TC541000P-25
TC541001P-20, TC541001P-25

DESCRIPTION

The TC541000P/TC541001P is a 131,072 word x 8 bit one time programmable read only memory, and molded in a 32 pin plastic package.

The TC541000P/TC541001P's access time is 200ns/250ns and has low power standby mode which reduces the power dissipation without increasing access time. The

electrical characteristics and programming method are the same as U.V. EPROM TC571000D/TC571001D's. Once programmed, the TC541000P/TC541001P can not be erased because of using plastic DIP without transparent window.

FEATURES

- Peripheral circuit : CMOS
Memory cell : N-MOS
- Fast access Time
TC541000P-20/TC541001P-20: 200ns
TC541000P-25/TC541001P-25: 250ns
- Low power dissipation
Active : 30mA/5.0MHz
Standby: 100 μ A ($T_a = 85^\circ\text{C}$)
- Single 5V power supply
- Wide operating temperature range: $-40 \sim 85^\circ\text{C}$
- Full static operation
- High speed programming operation: $t_{PW} = 0.1\text{ms}$
- Input and output TTL compatible
- JEDEC standard 32 pin: TC541000P
- 1M MROM compatible : TC541001P
- Standard 32 pin DIP plastic package

- Input Pulse Rise and Fall Time : 10ns Max.
- Input Pulse Levels : 0.45V and 2.4V
- Timing Measurement Reference Level : Input 0.8V and 2.2V, Output 0.8V and 2.0V

HIGH SPEED PROGRAM OPERATION

• TIMING CHART

- NOTE: 1. V_{CC} must be applied simultaneously or before V_{PP} and cut off simultaneously or after V_{PP} .
2. Removing the device from socket and setting the device in socket with $V_{PP} = 12.75V$ may cause permanent damage to the device.
3. The V_{PP} supply voltage is permitted up to 14V for program operation, so the voltage over 14V should not be applied to the V_{PP} terminal. When the switching pulse voltage is applied to the V_{PP} terminal, the overshoot voltage of its pulse should not be exceeded 14V.

OPERATION INFORMATION

The TC541000P/TC541001P's six operation modes are listed in the following table. Mode selec-

tion can be achieved by applying TTL level signal to all inputs.

		PGM	\overline{CE}	\overline{OE}	V_{PP}	V_{CC}	$O_0 \sim O_7$	POWER
READ OPERATION ($T_a = -40 \sim 85^\circ\text{C}$)	Read	H	L	L	5V	5V	Data Out	Active
	Output Deselect	*	*	H			High Impedance	
	Standby	*	H	*			High Impedance	Standby
PROGRAM OPERATION ($T_a = 25 \pm 5^\circ\text{C}$)	Program	L	L	H	12.75V	6.25V	Data In	Active
	Program Inhibit	*	H	*			High Impedance	
		H	L	H			High Impedance	
	Program Verify	H	L	L			Data Out	

Note: H; V_{IH} , L; V_{IL} , *: V_{IH} or V_{IL}

READ MODE

The TC541000P/TC541001P has three control functions. The chip enable (\overline{CE}) controls the operation power and should be used for device selection. The output enable (\overline{OE}) and the program control (PGM) control the output buffers, independent of device selection.

Assuming in that $\overline{CE} = \overline{OE} = V_{IL}$ and $\overline{PGM} = V_{IH}$, the output data is valid at the output after address access time from stabilizing of all addresses. The \overline{CE} to output valid (t_{CE}) is equal to the address access time (t_{ACC}).

Assuming that $\overline{CE} = V_{IL}$, $\overline{PGM} = V_{IH}$ and all addresses are valid, the output data is valid at the outputs after t_{OE} from the falling edge of \overline{OE} . And assuming that $\overline{CE} = \overline{OE} = V_{IL}$ and all addresses are valid, the output data is valid at the outputs after t_{PGM} from the rising edge of \overline{PGM} .

OUTPUT DESELECT MODE

Assuming that $\overline{CE} = V_{IH}$ or $\overline{OE} = V_{IH}$, the outputs will be in a high impedance state. So two or more ROMs can be connected together on a common bus line. When \overline{CE} is decoded for device selection, all deselected devices are in low power standby mode.

STANDBY MODE

The TC541000P/TC541001P has a low power standby mode controlled by the \overline{CE} signal. By applying a high level to the \overline{CE} input, the TC541000P/TC541001P is placed in the standby mode which recude the operating current to 100 μA by applying

MOS-high level (V_{CC}) and then the outputs are in a high impedance state, independent of the \overline{OE} inputs.

PROGRAM MODE

Initially, when received by customers, all bits of the TC541000P/TC541001P are in the "1" state which is erased state. Therefore the program operation is to introduce "0's" data into the desired bit locations by electrically programming.

The levels required for all inputs are TTL. The TC541000P/TC541001P can be programmed any location at anytime — either individually, sequentially, or at random.

PROGRAM VERIFY MODE

The verify mode is to check that the desired data is correctly programmed on the programmed bits. The verify is accomplished with \overline{OE} and \overline{CE} at V_{IL} and PGM at V_{IH} .

PROGRAM INHIBIT MODE

Under the condition that the program voltage (+12.75V) is applied to V_{PP} terminal, a high level \overline{CE} or \overline{PGM} input inhibits the TC541000P/TC541001P from being programmed. Programming of two or more EPROMs in parallel with different data is easily accomplished. That is, all inputs except for \overline{CE} or \overline{PGM} may be commonly connected, and a TTL low level program pulse is applied to the \overline{CE} and \overline{PGM} of the desired device only and TTL high level signal is applied to the other devices.

HIGH SPEED PROGRAM OPERATION

The device is set up in the high speed programming mode when the programming voltage (+12.75V) is applied to the V_{PP} terminal with $V_{CC} = 6.25V$ and $\overline{PGM} = V_{IH}$.

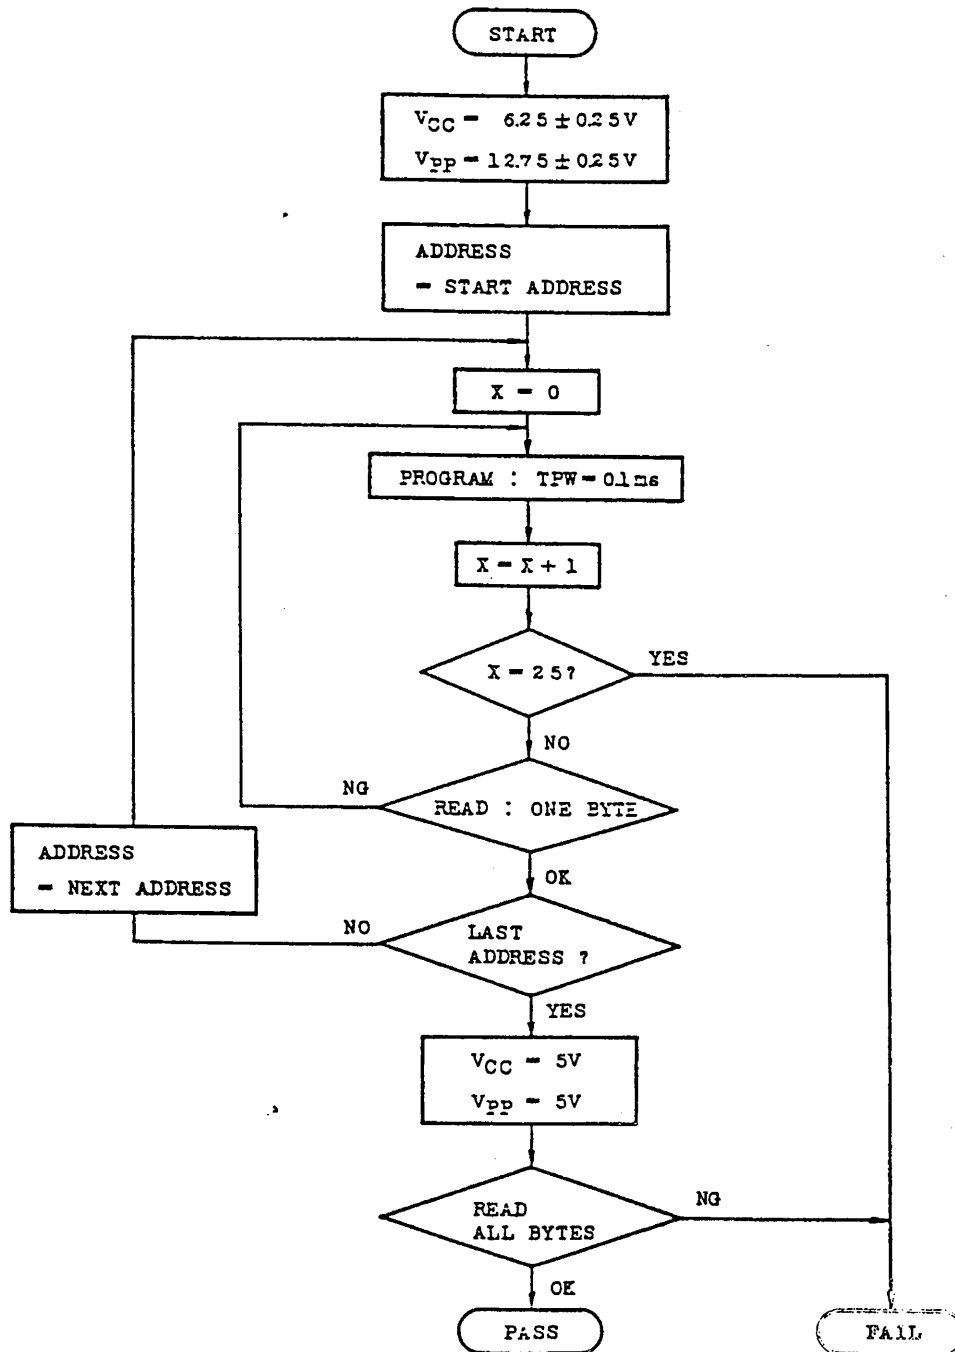

The programming is achieved by applying a single TTL low level 0.1 ms pulse the \overline{PGM} input after addresses and data are stable. Then the programmed

data is verified by using Program Verify Mode.

If the programmed data is not correct, another program pulse of 0.1ms is applied and then programmed data is verified. This should be repeated until the program operates correctly (max. 25 times).

When programming has been completed, the data in all addresses should be verified with $V_{CC} = V_{PP} = 5V$.

• FLOW CHART

ELECTRIC SIGNATURE MODE

Electric signature mode allows to read out a code from TC541000P/TC541001P which identifies it's manufacturer and device type.

The programming equipment may read out manufacturer code and device code from TC541000P/TC541001P by using this mode before program operation and automatically set program voltage (V_{PP}) and algorithm.

Electric Signature mode is set up when 12V is applied to address line A9 and the rest of address lines is set to V_{IL} in read operation. Data output in this conditions is manufacturer code. Device code is identified when address A0 is set to V_{IH} . These two codes possess an odd parity with the parity bit of MSB (07). The following table shows electric signature of TC541000P/TC541001P.

SIGNATURE \ PINS		A ₀	O ₇	O ₆	O ₅	O ₄	O ₃	O ₂	O ₁	O ₀	HEX. DATA
Manufacture Code		V_{IL}	1	0	0	1	1	0	0	0	98
Device Code	TC541000P	V_{IH}	1	0	0	0	0	1	1	0	86
	TC541001P		0	0	0	0	0	1	1	1	07

Notes: A9 = 12V \pm 0.5V

A1 ~ A8, A10 ~ A16, \overline{CE} , \overline{OE} = V_{IL}

\overline{PGM} = V_{IH}

OUTLINE DRAWINGS

Unit in mm

- NOTE: 1. Each lead pitch is 2.54mm. All leads are located within 0.25mm of their true longitudinal position with respect No.1 and No.32 leads.
2. This value is measured at the end of leads.
3. All dimensions are in millimeters.
